

AI Assistant - Help

Overview

The **AI Assistant** is a built-in help chat in Smart UI Designer. You can ask product-related questions in plain language — for example how a feature works, how to complete a task, or how to troubleshoot a problem.

The assistant is powered by [Chatbase](#) and has been trained on our product help files and documentation, knowledgebase articles and proprietary information. It is intended to give fast, conversational answers without leaving the Designer.

Figure 1: AI Assistant

The AI Assistant complements other help options:

Help option	Best for
AI Assistant	Quick, conversational answers while you work
Designer Help	Structured, context-sensitive topics in the local help file
Online Help	Full searchable documentation in your browser
Knowledge Base	Adroit Technologies articles and resources

Opening the AI Assistant

1. Open Smart UI Designer and connect to your project as usual.
 2. Switch to the **AI Assistant** tab
- Or
3. On the ribbon, select the **View** tab.
 4. In the **Content** group, click **AI Assistant** (chatbot icon).
 5. The **AI Assistant** panel appears on the **right side** of the Designer.

Click **AI Assistant** again to hide the panel. You can also dock, resize, or tab it like other Designer panels.

Tip: If you use the AI Assistant often, include it in your saved window layout so it stays visible when you open the Designer.

Using the chat

Once the panel is open:

1. Wait for the chat interface to load.
2. Type your question in the message box.

3. Press **Enter** or click the **Send Arrow**.
4. Read the reply and ask follow-up questions if needed.

Example questions

- “How do I publish a graphic form?”
- “How do I connect to the Agent Server?”
- “Why can’t I see the Properties panel?”
- “How to execute queries in script?”
- “How to trend historical datalog data?”

Be specific where you can. Instead of “It doesn’t work,” try “When I save a wizard, I get error X — what should I check?”

Panel toolbar

At the top of the AI Assistant panel:

Button	Purpose
Home	Return to the chat start page
Back	Go back in the chat/browser history
Forward	Go forward in the chat/browser history
Reload	Refresh the chat if it fails to load or stops responding

Use **Reload** if the panel is blank or the chat appears stuck.

Chat settings

The AI Assistant includes a few built-in options to help you manage your chat experience.

Starting a new chat

Click the **New Chat** button in the AI Assistant side-panel to start a new conversation.

Starting a new chat:

- Clears the current conversation history from the panel.
- Begins a fresh conversation with no previous chat context.
- Is useful when changing to a different topic or starting a new task.

Light and Dark mode

The AI Assistant supports both **Light** and **Dark** display modes.

To change the appearance:

1. Toggle the (sun/moon) button in the AI Assistant side-panel.
2. This should toggle the chat display between **Light** or **Dark** theme mode.

The selected theme changes only the appearance of the AI Assistant chat panel and does not affect the Smart UI Designer application theme.

Tip: Choose the theme that is most comfortable for your working environment. Dark mode can reduce eye strain when working in low-light conditions.

What the AI Assistant can and cannot do

It can help with

- Product features and terminology
- Step-by-step guidance based on our documentation
- Common troubleshooting and “how do I...?” questions
- Pointing you toward related topics or workflows

It cannot

- Change your project, graphic forms, or server settings
- Replace official support for critical production issues
- Guarantee answers that are always complete or up to date
- Access your local project files or server data directly

Treat replies as guidance. For important or safety-related changes, confirm against official documentation or your support channel.

Requirements and connectivity

The AI Assistant needs an **active internet connection**. It loads content from Chatbase (<https://www.chatbase.co>).

If the panel stays blank:

1. Check your internet connection.
2. Confirm your network allows access to chatbase.co.
3. Click **Reload** in the panel toolbar.
4. Close and reopen the AI Assistant from the **View** ribbon.

If problems continue, use **Online Help** or contact your administrator or support team.

Privacy and data

When you use the AI Assistant, your messages are processed through the Chatbase service. Do not enter passwords, license keys, personal data, or confidential project information unless your organization's policy allows it.

Refer to your company's IT and data policies, and to Chatbase's terms and privacy information, for full details.

Tips for better answers

1. **Name the feature** — e.g. “Enterprise Manager”, “Query Spider”, “Graphic Form Script”, “DataBinder”, “Objects Toolbox” etc.
2. **Describe what you were doing** — e.g. “While editing a wizard in Design mode...”
3. **Include error text** — copy the exact message when possible.
4. **Ask one question at a time** — clearer questions usually get clearer answers.
5. **Use follow-ups** — “Can you explain step 2 in more detail?” works well.

Frequently asked questions

Q: Is the AI Assistant the same as Online Help?

A: No. Online Help is static documentation. The AI Assistant answers in a chat format using documentation it was trained on.

Q: Do I need to log in separately?

A: The chat loads inside Smart UI Designer, not need to login into Chatbase bot separately.

Q: Why is the panel empty when I first open it?

A: The chat loads when you activate the panel. If it remains empty, check connectivity and click **Reload**.

Q: Can I use the AI Assistant offline?

A: No. An internet connection is required.

Q: Will the assistant know about my specific project?

A: No. It answers from trained documentation, not from your live project or server configuration.
