

Objects Toolbox — Help

Overview

The Objects Toolbox is a left-side panel in the Smart UI Designer that lets you browse, filter, and manage assets stored in the Object Repository project. Assets include Graphics (reusable graphic objects), Wizards (wizard-based graphic objects), Templates (template assets i.e. popups and faceplates etc.), and Objects (object templates with configurable instances).

You can drag assets from the toolbox onto an open Graphic Form, preview asset details, manage object instances, and perform repository actions from a context menu.

The toolbox is populated from assets in the Object Repository — typically assets you download from the Asset Library tab in the Designer.

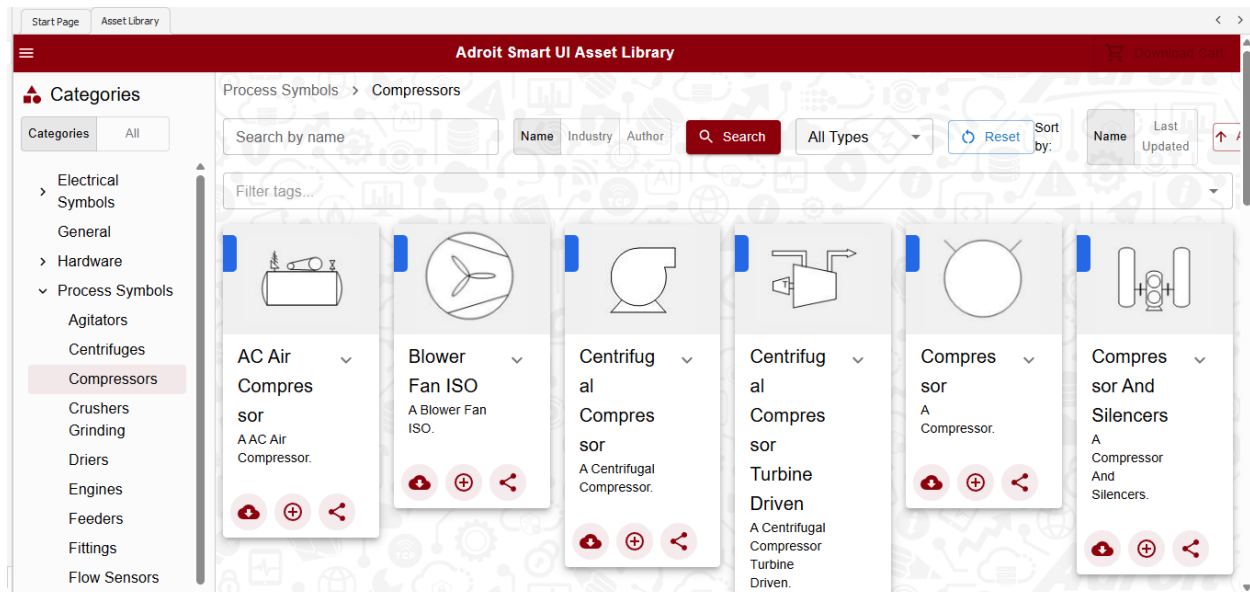

Figure 2: Asset Library embedded in Asset Library tab in Smart UI Designer

Prerequisites

- Connect to a server — the toolbox loads data from the Object Model datasource.
- Load the Asset Library (if adding new assets) browse and download graphics, wizards, templates, and object templates. Downloaded assets are imported into the Object Repository and appear in the toolbox after refreshing.
- Open a Graphic Form — drag-and-drop targets an active graphic form design surface.

Opening the Objects Toolbox

The Objects Toolbox appears as a dock panel titled Objects on the left side of the Designer.

To show or hide it:

- Go to the View ribbon tab.
- In the Content section, click Objects Toolbox.

You can dock, resize, or auto-hide the panel like other Designer panels.

Interface Overview

Filter bar (top)

Control	Purpose
Search	Filters items by name (case-insensitive)
Show	Multi-select filter by asset type: Graphics, Wizards, Templates, Objects

Both filters work together. Category folders stay visible only if they contain matching items.

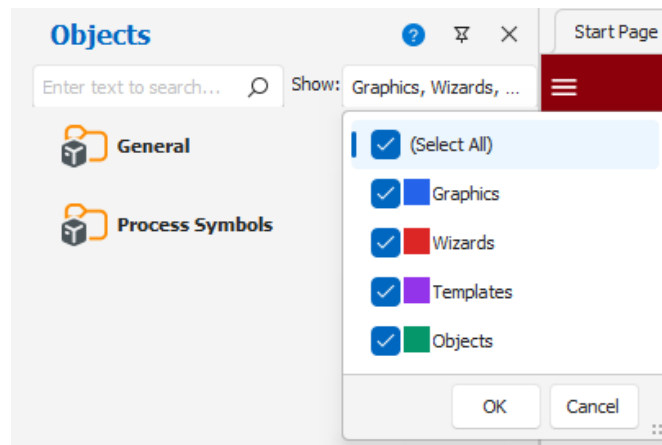

Figure 5: Filter assets by name and type

Asset tree (main area)

Assets are shown in an expandable accordion tree, organized by category folders matching the folder structure in the Object Repository.

Each item shows:

- An icon (preview thumbnail for most assets; special icons for object templates and instances)
- A colored vertical bar on the left indicating asset type
- A tooltip on hover with name, description, type, and a preview image (when available)

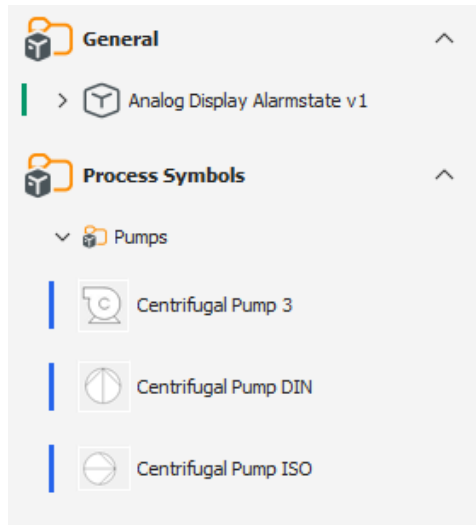

Figure 6: Assets organized in their respective categories

Asset Types and Color Coding

Each asset type has a distinct color bar (colors adapt to light/dark theme):

Type	Color (Light theme)	Description
Graphic	Blue	Standard graphic object
Wizard	Red	Wizard graphic object
Template	Purple	Template asset
Object	Green	Object template (can contain instances)
Instance	Amber/Orange	A configured instance of an object template

Icons:

- Category folders — folder/category icon
- Object templates — cube icon; shown as expandable groups
- Instances — filled cube icon; nested under their parent template

Finding Assets

Search by name

Type in the search box at the top. The tree hides items that do not match. Clear the search to show all items again.

Filter by type

Use the Show dropdown to include or exclude Graphics, Wizards, Templates, and Objects. All four types are selected by default.

Adding Assets to a Graphic Form (Drag and Drop)

- Open the Graphic Form you want to edit.
- In the Objects Toolbox, locate the asset.
- Left-click and drag the asset onto the graphic form design surface.
- Release to drop.

Asset type	Drop result
Graphic	Inserts a Graphic Object
Wizard	Inserts a Wizard Graphic Object, prompting for substitutions if required
Instance	Inserts the Object Instance onto the form, prompting for substitutions if required

Tip: Hover over an item before dragging to confirm name, description, and preview in the tooltip.

Object Templates and Instances

Object templates behave differently from other assets. They appear as expandable groups (green bar, cube icon). Instances created from a template appear as child items under that template (amber bar, filled cube icon).

Creating instances

- Right-click an object template.
- Choose Create New Instances.
- Complete the instance creation flow (supports bulk creation of multiple instances).
- New instances appear under the template; the template expands automatically.

Managing instances

Action	Description
Deploy Instance	Starts instance deployment via the Object Model
Edit Instance	Opens the instance for editing
Delete Instance	Removes the instance (with confirmation)

Context Menu Reference

Right-click an item to open the context menu. Available actions depend on what you clicked.

All items

Action	Description
Import	Imports already downloaded Asset zip files into the Object Repository
Expand All	Expands every node in the tree
Collapse All	Collapses every node
Refresh	Reloads all assets from the Object Repository

Repository assets (Graphics, Wizards, Templates, Objects)

Action	Available for	Description
View Details	All assets	Opens a flyout with name, description, type, and a gallery of preview images
View Documentation	Assets with documentation	Opens linked documentation (URL opens in your default browser)
Copy Path	Templates and Wizards only	Copies the asset's DataElement path to the clipboard
Delete	All assets	Deletes the asset from the Object Repository (with confirmation)
Create New Instances	Object templates only	Creates one or more instances from the template

Instances

Action	Description
Deploy Instance	Deploy the instance via the Object Model
Edit Instance	Edit instance configuration
Delete Instance	Delete the instance

Import Assets

Import Assets option allows you to import already downloaded Asset zip files into the Object Repository. This is useful when connecting with a Designer when there is no internet connectivity available to connect to and view the Asset Library.

View Details

View Details opens a flyout panel showing Name, Description, Type, a preview image, and a thumbnail strip when multiple preview images exist. The flyout closes when you click outside it or move the mouse away.

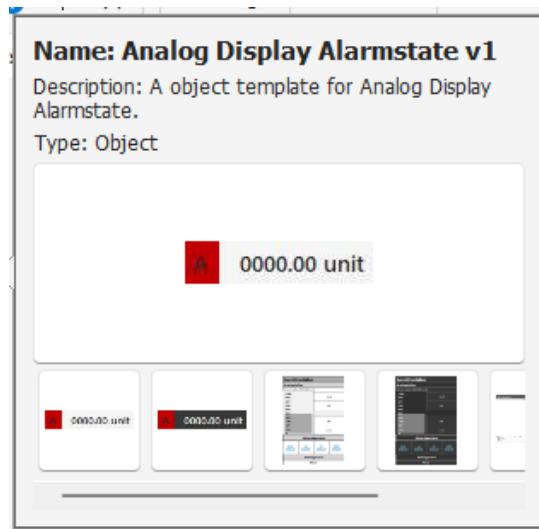

Figure 7: Asset Preview via View Details

Copy Path (Templates and Wizards)

Copy Path puts the asset's DataElement path reference on the clipboard, for example:

```
{ServerName}.Object Repository.{Category}.{AssetName}.{FileName}
```

Use this when you need the exact reference in scripts, bindings, or other Designer tools.

Typical Workflows

Workflow 1: Add a graphic from the Asset Library to a form

- Connect to the server and open the Asset Library tab.
- Download the desired graphic — it is imported into the Object Repository.
- Open the Objects panel (Objects Toolbox).
- If the asset does not appear, right-click and choose Refresh.
- Drag the graphic onto your Graphic Form.

Workflow 2: Use an object template with instances

- Download the object template from the Asset Library, if you not already.
- Locate the object template in the Objects Toolbox (green bar).
- Right-click and choose Create New Instances.
- Expand the template to see its instances.
- Drag an instance onto the Graphic Form.
- Use Deploy Instance or Edit Instance from the context menu as needed.

Workflow 3: Clean up unused assets

- Right-click the asset and choose Delete.
- Confirm when prompted.
- The item is removed from the Object Repository and disappears from the tree.

Tips and Troubleshooting

Issue	What to try
Toolbox is empty	Confirm you are connected to a server. Use Refresh after downloading from the Asset Library.
New download not visible	The toolbox refreshes automatically after a successful Asset Library import; if not, use Refresh manually.
Cannot find an asset	Clear the search box and ensure all types are checked in Show.
Drag-and-drop does nothing	Ensure a Graphic Form is open and active as the drop target.
Instance actions missing	Right-click the instance (child item), not the parent template.

Documentation link does nothing

Documentation must be a valid URL or file.
