

What's New: Objects Toolbox

Adroit 11 Smart UI Designer | Release highlight

Executive Summary

The new Objects Toolbox brings your Asset Library and Object Repository directly into the Smart UI Designer workspace. Designers can browse, search, preview, and place graphics, wizards, and object instances on Graphic Forms without leaving the design surface.

This release closes the loop between discovering assets online and using them in production projects - reducing friction, speeding up screen design, and making reusable content easier to manage at scale.

Key Features at a Glance

Feature	What it does	Why it matters
Objects Toolbox panel	Dedicated left-side panel in Smart UI Designer	Keeps all repository assets visible while you design
Asset Library integration	Downloaded assets appear in the toolbox automatically	No manual import steps between browse and build
Drag and drop to Graphic Forms	Place graphics, wizards, and instances directly on the canvas	Faster screen assembly with fewer clicks
Search and type filters	Find assets by name or category (Graphics, Wizards, Templates, Objects)	Scales well as libraries grow
Visual asset previews	Tooltips and View Details flyout with images and descriptions	Choose the right asset before placing it
Object template instances	Create, edit, deploy, and delete instances from one place	Standardizes object reuse across projects
Bulk instance creation	Create multiple instances from a template in one action	Saves time on large deployments
Context menu actions	Copy path, view documentation, import, refresh, expand/collapse, delete	Power-user workflows without leaving the panel
Color-coded asset types	Instant visual identification of graphics, wizards, templates, and objects	Reduces errors and improves scanability

Feature Highlights

All your assets, one panel

Browse the full Object Repository without switching tools.

The Objects Toolbox organizes graphics, wizards, templates, and object templates in a searchable tree aligned with your repository categories. Everything you download from the Asset Library is ready to use in the same workspace where you design Graphic Forms.

Customer benefit: Less context switching means faster project delivery and a smoother designer experience.

Drag, drop, done

Place assets on Graphic Forms in a single gesture.

Select any supported asset and drag it onto an open Graphic Form. Graphics and wizards become design elements immediately; object instances connect to your Object Model with the correct references built in.

Customer benefit: Accelerates HMI and SCADA screen development for both new and experienced users.

Find what you need, fast

Search and filter as your library grows.

A built-in search box and multi-select type filter help teams locate the right asset among hundreds of items. Category folders expand and collapse so large libraries stay manageable.

Customer benefit: Supports enterprise-scale content libraries without slowing designers down.

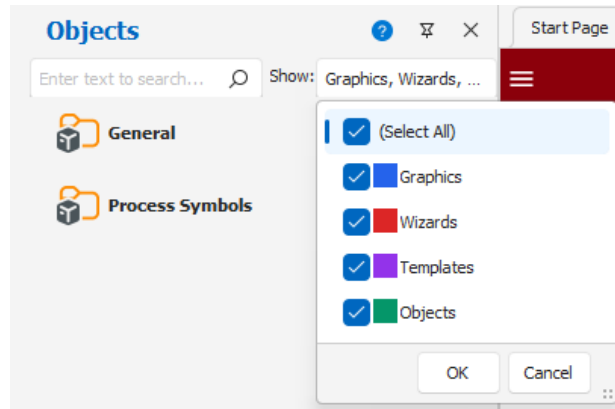

Figure 3: Filter assets by name and type

Preview before you place

See details and thumbnails before committing to the canvas.

Hover tooltips show name, description, type, and preview images. View Details opens a rich flyout with larger previews and gallery of multiple thumbnails when available. If the documentation reference is a URL, it opens in the browser; if it is a file, the file opens directly.

Customer benefit: Fewer mistakes, better asset reuse, and more confidence in design decisions.

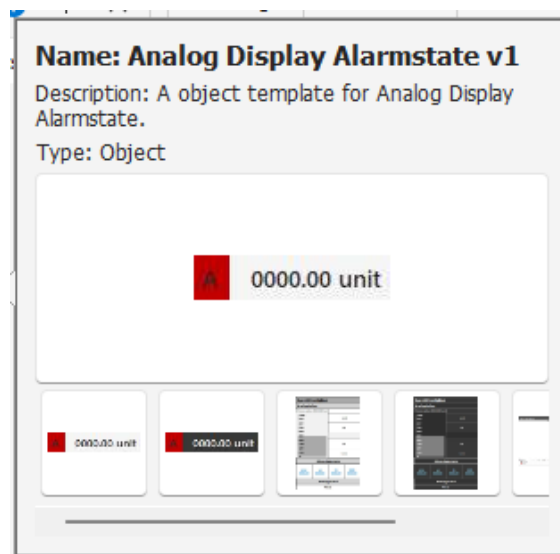

Figure 4: Asset Preview via View Details

Object templates and instances, simplified

Manage reusable object definitions and their live instances in one view.

Object templates appear as expandable groups with dedicated icons. Create new instances (including bulk creation), edit configuration, deploy to runtime, or remove instances - all from a

right-click menu. Instances are visually distinct and draggable onto Graphic Forms like any other asset.

Customer benefit: Makes standardized equipment and process objects easier to roll out consistently across sites and projects.

Stays in sync with your library

Refresh when you need it; auto-update when you download.

After downloading from the Asset Library, new assets flow into the Object Repository and the toolbox refreshes automatically. Manual refresh is also available anytime from the context menu.

Manual import of already downloaded Asset zip files into the Object Repository via the Objects Toolbox is available when there is no internet connectivity.

Customer benefit: Teams always work with the latest approved content.

Before and After

Before	After
Browse assets in one place, import or locate them elsewhere	Browse and use assets in the same Designer panel
Limited visibility into repository content while designing	Live tree of all repository assets beside the canvas
Manual steps to place reusable graphics and templates	Drag and drop directly onto Graphic Forms
Object instances managed through separate workflows	Create, deploy, edit, and delete instances from the toolbox
Hard to preview asset content before use	Tooltips and detail flyout with images and descriptions

Who Benefits

Audience	Value
HMI / SCADA designers	Faster screen building with immediate access to approved graphics and templates
System integrators	Quicker rollout of standardized objects and instances across projects
Asset Library curators	Clear path from published content to in-project usage
Operations and engineering teams	Consistent reuse of validated design components
Training and support	Single, intuitive panel to teach asset discovery and placement

Technical Scope (internal reference)

Product: Smart UI Designer (Objects Toolbox panel, View ribbon entry)

Supported asset types: Graphics, Wizards, Templates, Object templates, Instances

Related capabilities: Asset Library tab, Object Repository project, Graphic Form drag-and-drop

Notable enhancements in recent releases: bulk instance creation, deploy instance, visual icons for templates/instances, resource disposal improvements
